ULTIMAT

Resurfacing solutions for pavement cracking and deformation

ULTIMAT

Product ULTIMAT

Client West Dumbartonshire Council

Main Contractor West Dumbartonshire Council

Location Duntocher Road Clydebank

Completion November 2014

ULTIMAT

Resurfacing solutions for pavement cracking and deformation

THE CHALLENGE

This heavily trafficked road, used by buses and commercial vehicles, required resurfacing. The client, West Dumbartonshire Council needed a durable, cost-effective solution that would resist the heavy traffic, but also allow work to be completed quickly with minimal disruption to local road users.

OUR SOLUTION

Tarmac has been working in partnership with West Dumbartonshire Council for many years to supply aggregates and asphalt. Through our commitment to continuous improvement and leading in innovation to assist with delivering improvements in construction techniques, faster construction methods, health and safety benefits and improvements to sustainability targets we suggested the use of ULTIMAT as an alternative to conventional surface material in order to minimize disruption and time taken on site.

RESULTS AND BENEFITS

ULTIMAT is a single layer application material that eliminates the need for conventional binder and surface course construction, for faster completion times and minimal disruption. ULTIMAT contains a modified binder, designed aggregates and fibre additive. As a result it is stronger and gives superior resistance to deformation and cracking than conventional asphalt. For this contract West Dumbartonshire Council installed 318T of material in a single layer of 35mm, therefore halving construction time which reduced the program and used less material than if offering a conventional solution.
